

Dealing with Rayleighs and Emission Measure: a worked example

In ISM studies, the standard unit of surface brightness for emission lines is the Rayleigh:

$$1 \text{ Rayleigh} = \frac{10^6}{4\pi} \text{ photons s}^{-1} \text{ cm}^{-2} \text{ sr}^{-1}$$

The conversion between Rayleighs and surface brightness expressed in energy flux per square arcsec (e.g, $\text{erg s}^{-1} \text{ cm}^{-2} \text{ arcsec}^{-2}$) depends on the wavelength of the emission line:

To convert, we need some useful numbers:

$$\begin{aligned} 1 \text{ photon} &= h\nu \text{ or } hc/\lambda \text{ ergs} = 1.98645 \times 10^{-8} / \lambda_{\text{\AA}} \text{ ergs} \\ 1 \text{ steradian} &= 32400/\pi^2 \text{ degrees}^2 = 4.254517 \times 10^{10} \text{ arcsec}^2 \end{aligned}$$

So

$$1 \text{ Rayleigh} = 1.8704 \times 10^{-6} h\nu \text{ erg s}^{-1} \text{ cm}^{-2} \text{ arcsec}^{-2}$$

or

$$1 \text{ Rayleigh} = 3.71546 \times 10^{-14} \lambda^{-1} \text{ erg s}^{-1} \text{ cm}^{-2} \text{ arcsec}^{-2}$$

with λ in Angstroms.

For different recombination lines:

$$\begin{aligned} \text{H}\alpha: \lambda &= 6562.80 \text{\AA} \\ \text{H}\beta: \lambda &= 4861.32 \text{\AA} \\ \text{Ly}\alpha: \lambda &= 1215.67 \text{\AA} \end{aligned}$$

Thus

$$\begin{aligned} \text{H}\alpha: 1 \text{ Rayleigh} &= 5.661 \times 10^{-18} \text{ erg s}^{-1} \text{ cm}^{-2} \text{ arcsec}^{-2} \\ \text{H}\beta: 1 \text{ Rayleigh} &= 7.643 \times 10^{-18} \text{ erg s}^{-1} \text{ cm}^{-2} \text{ arcsec}^{-2} \\ \text{Ly}\alpha: 1 \text{ Rayleigh} &= 3.056 \times 10^{-17} \text{ erg s}^{-1} \text{ cm}^{-2} \text{ arcsec}^{-2} \end{aligned}$$

The Emission Measure (EM), for pure recombination can be written:

$$\begin{aligned} EM &= 2.75 T_4^{0.9} I(\text{H}\alpha) \text{ cm}^{-6} \text{ pc} \\ &= 7.84 T_4^{0.9} I(\text{H}\beta) \text{ cm}^{-6} \text{ pc} \end{aligned}$$

for surface brightness, $I(\text{line})$ expressed in units of Rayleighs, or

$$\begin{aligned} EM &= 4.858 \times 10^{17} T_4^{0.9} S(\text{H}\alpha) \text{ cm}^{-6} \text{ pc} \\ &= 1.026 \times 10^{18} T_4^{0.9} S(\text{H}\beta) \text{ cm}^{-6} \text{ pc} \end{aligned}$$

for surface brightness, $S(\text{line})$ expressed in units of $\text{erg s}^{-1} \text{ cm}^{-2} \text{ arcsec}^{-2}$.

For $\text{Ly}\alpha$, the situation is a little more complicated. If we adopt the Case A ratio of $\text{Ly}\alpha/\text{H}\beta \approx 33$, this implies

$$EM \approx 0.24 T_4^{0.9} I(\text{Ly}\alpha) \text{ cm}^{-6} \text{ pc}$$
